

CareCircle

A care companion for older people and patients with chronic conditions. Patients choose what to share with family members and carers; their choices appear in the GP consent view.

This is not one patient.

12_m

results seen in the NHS App **every month**

NHS App roadmap, July 2026

×

47%

never recorded as told to the patient

UK audit, 2,572 patients, 57 practices

=

68_m

results **a year** with no evidence the patient was told

EXTRAPOLATED

And GPs spend about **35,000 hours every working day** managing results. EXTRAPOLATED

12m × 47% × 12 months = 67.7m. 74 min per GP a day (Poon 2004) × 28,426 full-time GPs (NHS England, July 2026) = 35,059 hours. Full working and caveats in the notes.

All patient data synthetic · Fictional demo, not an official NHS product

Results go nowhere, then aren't understood, then the family is locked out.

01

Blind to the trend

Each result is read on its own. Nobody reads the trend.

02

No proof she was told

The record never says whether she was told.
Nothing chases it.

🔒 03

Numbers, not meaning

The App shows a number and says ring your GP.
Her family sees nothing.

CareCircle turns every result into the right explanation and next action for every trusted person, **under the patient's control.**

1. Sees it coming

Reads the whole trend, not one result.

2. Tells her first

Nothing reaches the family until she has been told and says yes.

3. Tells the right people the right way

Daughter gets the numbers. Husband gets the lift to arrange. Son gets a yes or no.

What happens to Eleanor now.

TODAY

- Four low white cell counts since May, each filed on its own.
- A result lands in the record. Nobody knows if she has been told.
- Her family knows nothing. She is the messenger.
- Nobody follows up. Nothing chases it.

WITH CARECIRCLE

- The trend is flagged as worsening the second time, in July, not filed a fourth time.
- The result is held. The practice talks her through it. She says yes.
- Grace gets the numbers. Idris gets the lift to arrange. Thomas gets “nothing needed this week”.
- Three days with no confirmation: a GP task is raised and her landline rings.

90 seconds, live against Anima.

- **Eleanor's body.** Nine systems coloured from her live record in the Body tab, consent-gated per system; the Home boxes say what needs watching. Trend cards

LIVE FROM THE PROTOTYPE
- **Order the LFT in Anima; advance the clock 121 minutes.** The result lands as a real state change.
- **Held.** Eleanor's phone: a result has arrived and the practice will talk her through it. Family sees nothing.
- **Her yes.** Three versions go out: Grace numbers, Idris logistics, Thomas yes/no. A task appears in Anima's activity trail.
- **Grace asks about a result she cannot see.** NOT_SHARED, no hint. She asks for access; Eleanor approves from a card; the GP consent view updates live.
- **The morning check** reads the 08:30 appointment from the record and posts to the family group: who can give Eleanor a lift?

“There are 3 shifts, but only one core purpose: to put power in patients' hands.”

Chapter 1, p22

“Patients will have control over whether this data is shared.”

Chapter 3, My Health, pp50 to 51. And My Carer, p51: carers gain access to the App on their loved one's behalf.

“The most common reasons for complaints is poor communication.”

Chapter 6, p89

Chapters 2, 3 and 6.

No result ever sits uncommunicated.

And when it is communicated, every trusted person gets the right version, in their words, under her control.

3 × 6

sharing levels over six record categories, plus custom mixes

Every

agent tool call checks consent and is written to the audit rail

9

body systems coloured from the live record, consent-gated per system, on a licensed 3D figure

1

transaction mirrors each consent change to the GP view: observation plus audit

Next: fold the disclosure gate, the escalation and the 30-day trend rules, prototyped today against the live Anima world, into the app's scheduled check. Pilot at one practice. Wire consent to NHS App proxy access.
