

A care companion for older people and patients with chronic conditions. Patients choose what to share with family members and carers; their choices appear in the GP consent view.

## Eleanor Chen, 83

SIM-000006

- Four abnormal blood panels since May, white cells **2.7 · 1.6 · 1.3 · 2.1**  $\times 10^9/L$  against a range of 4 to 11. **Each one was filed. Nobody looked at them together.** The only message she ever received was about paperwork.
- Admitted at **04:20 this morning**. A GP appointment still booked for 08:30.
- Landline only. Her husband could not drive her to her last review. **Nothing in her record has gone to her family.**

**She is the human middleware between her clinicians and her family.**

**"I want to know what that is. I want to know what's going on. I want to be aware."**

# This is not one patient.

47%

of blood results have **no record of being communicated** to the patient. 31% for abnormal results.

PACT audit, 2,572 patients, 57 practices

5.6m

results a month, around **68m a year**, with no evidence the patient was told.

**EXTRAPOLATED** 12m NHS App result views a month at 47%

35,000

**GP-hours every working day** spent managing results.

**EXTRAPOLATED** 74 minutes a day per doctor across 28,426 FTE GPs in England

1reading

is not effective at spotting decline. **The trajectory is**, and every GP system already holds the data.

41 serious incidents in 13 months from uncommunicated results, including a 45 mm lung mass (HSIB 2019). 5 million unpaid carers. 0.4% of portal users have shared access.

# Results go nowhere, then aren't understood, then the family is locked out.

01

## Not seen coming

Results are reviewed one at a time. No one reads the trend.

02

## Not told

No reliable “patient informed” state exists in the record, and nothing routes a result to the people who need to act.

03

## Not understood, locked out

The App shows the number and says ring your GP; only 51% of adults can find the out-of-range value. Proxy access hands a person the whole record after a practice-led setup, and almost nobody has it.

# Kindred turns every result into the right explanation and next action for every trusted person, under the patient's control.

# 90 seconds, live against Anima.

- **Eleanor's trend cards**, improving / watch / worsening, generated from her real panel history. LIVE FROM THE PROTOTYPE
- **Order the LFT in Anima; advance the clock 121 minutes.** The result lands as a real state change.
- **Held.** Eleanor's phone: a result has arrived and the practice will talk her through it. Family sees nothing.
- **Her yes.** Three versions go out: Grace numbers, Idris logistics, Thomas yes/no. A task appears in Anima's activity trail.
- **Grace asks about a result she cannot see.** NOT\_SHARED, no hint. She asks for access; Eleanor approves from a card; the GP consent view updates live.
- **The morning check** reads the 08:30 appointment from the record and posts to the family group: who can give Eleanor a lift?

**“There are 3 shifts, but only one core purpose: to put power in patients' hands.”**

Chapter 1, p22

**“Patients will have control over whether this data is shared.”**

Chapter 3, My Health, pp50 to 51. And My Carer, p51: carers gain access to the App on their loved one's behalf.

**“The most common reasons for complaints is poor communication.”**

Chapter 6, p89

**Chapters 2, 3 and 6.**

# No result ever sits uncommunicated.

And when it is communicated, every trusted person gets the right version, in their words, under her control.

**3** × 6

sharing levels over six record categories, plus custom mixes

**Every**

agent tool call checks consent and is written to the audit rail

**6**

plain-English trend cards from a year of bloods and the watch data in her record

**1**

transaction mirrors each consent change to the GP view: observation plus audit

**Next:** fold the trend engine, the gate and the escalation, prototyped today against the live Anima world, into the app. Pilot at one practice. Wire consent to NHS App proxy access.
